

The process of Airline Identification and processing of information through one fixed application. An identification card labeled with the corresponding airline encoded with information pertaining to identification and airline member information. A photograph is located on the back of the card. The card is read by device at the ticket counter and all pertinent information is uploaded to a terminal, opening a company member profile. Fingerprint identification is linked via a database and matched to cardholder with fingerprint scan technology. Ticketing, reservation and baggage claim information as well and frequent flier information is linked to one database which charges flight fees to an account linked to the card. This card is also swiped at the boarding gate for entrance approval and used as a boarding pass. This technology is also linked to security checkpoints to verify identification and flight reservation. Upon arrival this card is required to enter baggage claim as verification of ownership of said articles.
